

IBM DATA SCIENCE CAPSTONE PROJECT

Space X Falcon 9 Landing Analysis

Francisco Javier Ordonez Araujo September 2024

Outline

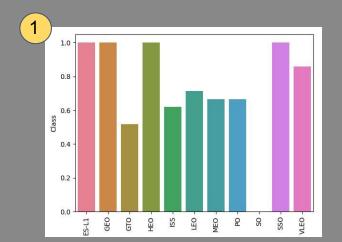

- 01 Executive Summary
- 02 Introduction
- Methodology
- 04 Results
- 05 Conclusions
- Of Appendix

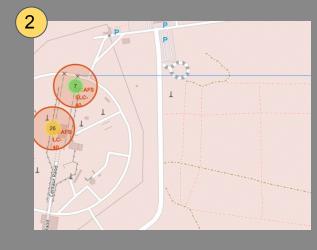

Executive Summary

Summary of Methodologies:

This project follows these steps:

- Data Collection
- Data Wrangling
- Exploratory Data Analysis
- Interactive Visual Analytics
- Predictive Analysis (Classification)

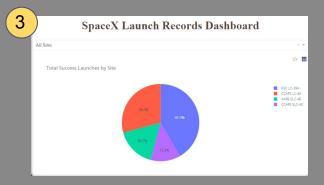

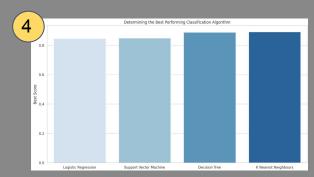

Summary of Results:

This project produced the following outputs and visualizations:

- **1.** Exploratory Data Analysis (EDA) results
- Ceospatial analytics
- Interactive dashboard
- Predictive analysis of classification models

Introduction

- SpaceX's Cost Advantage: The Falcon 9 rocket costs approximately \$62 million per launch, significantly lower than the industry average of \$165 million. This is largely due to SpaceX's ability to land and reuse the first stage of the rocket, making it a cost-efficient solution in space exploration.
- Predicting Launch Costs: Accurately predicting whether the first stage will land allows us to refine the launch cost estimate, which is critical in determining if an alternative company should bid against SpaceX for a launch contract.
- Project Goal: This project focuses on predicting the success of Falcon 9 first stage landings, enabling better cost analysis and decision-making for future space missions.

Methodology

Data collection

- Taken from SpaceX REST API.
- Web Scraping.

Perform data wrangling

- Cleaned data by handling missing values using .fillna().
- Analyzed data distributions using .value_counts() for launch sites, orbits, and mission outcomes.
- Created landing outcome labels: 0 for unsuccessful booster landings, 1 for successful landings.

Exploratory Data Analysis (EDA)

- Executed SQL queries to manipulate and explore the SpaceX dataset.
- Visualized relationships between variables and identified patterns using Pandas and Matplotlib.

Interactive Visual Analysis

- Performed geospatial analysis with Folium.
- Built an interactive dashboard using Plotly Dash for real-time data exploration.

Data Modeling and Evaluation

- Pre-processed data using Scikit-Learn, including standardization and train-test split.
- Trained various classification models, optimized using GridSearchCV, and evaluated performance using confusion matrices and accuracy metrics.

Data Collection-SPACE X REST API

1 Data Acquisition

 Send a GET request to the SpaceX REST API and convert the JSON response into a Pandas DataFrame for structured analysis.

2 Data Cleaning

- Use custom logic and functions to clean and organize the data, storing key fields like BoosterVersion, PayloadMass, and LaunchSite in lists.
- Construct a dictionary from these lists for dataset creation.

3 DataFrame Creation

 Create a Pandas DataFrame from the constructed dictionary for easy manipulation.

4 Filtering and Refinement

• Filter the dataset for Falcon 9 launches, reset the *FlightNumber* column, and replace missing PayloadMass values with the column's mean.

```
1 ow let's start requesting rocket launch data from SpaceX API with the following URL:

spacex_url="https://api.spacexdata.com/v4/launches/past"
response = requests.get(spacex_url)

# Use json_normalize method to convert the json result into a dataframe data = pd.json_normalize(response.json())
```

```
#Global variables
                           # Call getBoosterVersion
                                                    launch dict = {'FlightNumber': list(data['flight number']),
                          getBoosterVersion(data)
BoosterVersion = []
                                                    'Date': list(data['date']),
PayloadMass = []
                                                    'BoosterVersion':BoosterVersion,
                           BoosterVersion[0:5]
Orbit = []
                                                    'PayloadMass':PayloadMass,
LaunchSite = []
                                                    'Orbit':Orbit,
                         ['Falcon 1', 'Falcon 1', 'Falc
Outcome = []
                                                    'LaunchSite':LaunchSite,
Flights = []
                                                    'Outcome':Outcome,
GridFins = []
                          # Call getLaunchSite
                                                    'Flights':Flights,
                          getLaunchSite(data)
Reused = []
                                                    'GridFins':GridFins,
Legs = []
                                                    'Reused': Reused,
LandingPad = []
                                                    'Legs':Legs,
                          # Call getPayloadData
Block = []
                                                    'LandingPad':LandingPad,
                           getPayloadData(data)
ReusedCount = []
                                                    'Block':Block,
Serial = []
                                                    'ReusedCount':ReusedCount,
Longitude = []
                                                    'Serial':Serial.
                          # Call getCoreData
                                                    'Longitude': Longitude,
Latitude = []
                           getCoreData(data)
                                                    'Latitude': Latitude}
```

```
# Create a data from launch_dict
df = pd.DataFrame.from_dict(launch_dict)
```

data falcon9

```
data_falcon9 = df[df['BoosterVersion']!='Falcon 1']

data_falcon9.loc[:,'FlightNumber'] = list(range(1, data falcon9.shape[0]+1))
```

Data Collection-WEB SCRAPING

- Request the HTML page from the static URL.
- Assign the response to an object.
- Create a BeautifulSoup object from the HTML response object.
 - Find all tables within the HTML page.
- Collect all column header names from the tables found within the HTML page.
- Use the column names as keys in a dictionary.
 - Use custom functions and logic to parse all launch tables to fill the dictionary values.
- Convert the dictionary to a Pandas DataFrame ready for export.

```
tatic_url = "https://en.wikipedia.org/w/index.php?title=List_of_Falcon_9_and_Falcon_Heavy_launches&oldid=1027686922"

# use requests.get() method with the provided static_url

response = requests.get(static_url)

# assign the response to a object

data = response.text
```

```
# Use BeautifulSoup() to create a BeautifulSoup
# |object from a response text content
soup = BeautifulSoup(data, 'html5lib')
print(soup.title)
```

```
column_names = []
# Apply find_all() function with 'th' element on first_launch_table
# Iterate each th element and apply the provided extract_column_from header() to get a column name
# Append the Non-empty column name ('if name is not None and len(name) > 0') into a list called column_names
for row in first_launch_table.find_all('th'):
    name = extract_column_from_header(row)
    if(name != None and len(name) > 0):
        column_names.append(name)
```

```
launch dict= dict.fromkeys(column names)
# Remove an irrelevant column
del launch dict['Date and time ( )']
# Let's initial the launch dict with each value to be an empty list
launch dict['Flight No.'] = []
launch dict['Launch site'] = []
launch dict['Payload'] = []
launch dict['Payload mass'] = []
launch dict['Orbit'] = []
launch dict['Customer'] = []
launch dict['Launch outcome'] = []
# Added some new columns
launch dict['Version Booster']=[]
launch dict['Booster landing']=[]
launch dict['Date']=[]
launch dict['Time']=[]
```

```
df = pd.DataFrame(launch_dict)
df.head()
```

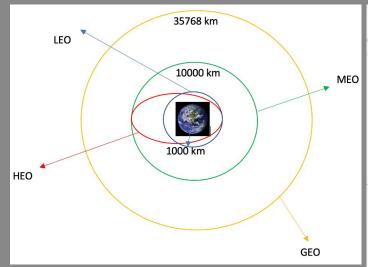

Data Manipulation & Wrangling – PANDAS

Context

- Dataset includes SpaceX launch facilities (LaunchSite column) and orbit types (Orbit column).
- Each launch has a landing outcome (Outcome column)
 classified as success or failure.

Data Wrangling

- Defining a set of unsuccessful (bad) outcomes called bad outcome.
- Creating a list landing_class, where the element is 0 if the corresponding row in the Outcome column is in bad_outcome, otherwise it's 1.
- Creating a Class column that contains the values from the landing_class list.
 - Exporting the DataFrame as a .csv file for further analysis.

```
# Apply value counts on Orbit column
    df['Orbit'].value counts()
 GT0
 ISS
 VLE0
 LE0
 SSO
 MEO
 ES-L1
 HE0
 SO
 GE0
  # landing outcomes = values on Outcome column
  landing outcomes = df['Outcome'].value counts()
False ASDS
True Ocean
False Ocean
None ASDS
False RTLS
Name: Outcome, dtype: int64
```

```
1 e create a set of outcomes where the second stage did not land successfully:

| bad_outcomes=set(landing_outcomes.keys()[[1,3,5,6,7]]) |
| bad_outcomes |
| {'False ASDS', 'False Ocean', 'False RTLS', 'None ASDS', 'None None'}
```

```
df['Class'] = landing_class

# Export the DataFrame as a CSV file
df.to_csv("dataset_part_2.csv", index=False)
```

```
anding_class = 0 if bad_outcome
anding_class = 1 otherwise

landing_class = []

for outcome in df['Outcome']:
    if outcome in bad_outcomes:
        landing_class.append(0)
    else:
        landing_class.append(1)
```

EDA with Data Visualization

- Scatter Charts: Utilized to examine relationships between flight number, launch site, and payload, as well as correlations between orbit type and flight number, offering insights into the distribution of numeric variables.
- **Bar Charts**: Created to illustrate the relationship between **success rates** and **orbit types**, allowing easy comparison of categorical and numerical data.
- **Line Charts**: Employed to display trends in **launch success rates over time**, helping to visualize changes across multiple years (2010–2020).

EDA with SQL

- Names of Unique launch sites in the space mission.
- Five records where launch sites begin with string 'CCA'.
- Total payload mass by NASA (CRS).
- Average payload mass carried by booster version F9 v1.1.
- First successful landing outcome in ground pad Success in drone ship, payload mass >4000 but <6000
- Total number of successful and failure mission outcomes.
- Booster_versions with maximum payload mass.
- Month names of failure landing outcomes in drone ship in year 2015.
- Landing outcome counts between "2010-06-04" and "2017-03-20" in descending order.

Build an Interactive Map with Folium

In the interactive map created with Folium, I integrated various elements to enhance the visualization. Markers were added to pinpoint specific launch locations, such as the NASA JSC space station launch site. Circles were used to highlight key areas, each accompanied by text labels at specified coordinates for clarity. Additionally, lines were drawn to represent the proximity between launch sites, providing a clear depiction of spatial relationships.

Build a Dashboard with Plotly Dash

In the Plotly Dash user application I have added a dropdown list and a range slider to allow a user to interact with a pie chart and the scatter point chart.

Predictive Analysis (Classification)

- The cleaned dataset was imported, with features assigned to X and the target variable to Y. Using sklearn's **StandardScaler**, the data was normalized, followed by a train-test split where 80% was used for training and 20% for testing.
- Multiple models were instantiated, and hyperparameter tuning was performed using **GridSearchCV** to identify the best-performing parameters for each model.
- After training, the **DecisionTreeClassifier** delivered the best results, achieving an accuracy of 88.88% and an F1-score of 88.21% on the test set. The performance was optimized through **GridSearchCV** for hyperparameter tuning, ensuring robust evaluation on unseen data.

RESULT

Exploratory Data Analysis

Interactive Analytics

Predictive Analysis

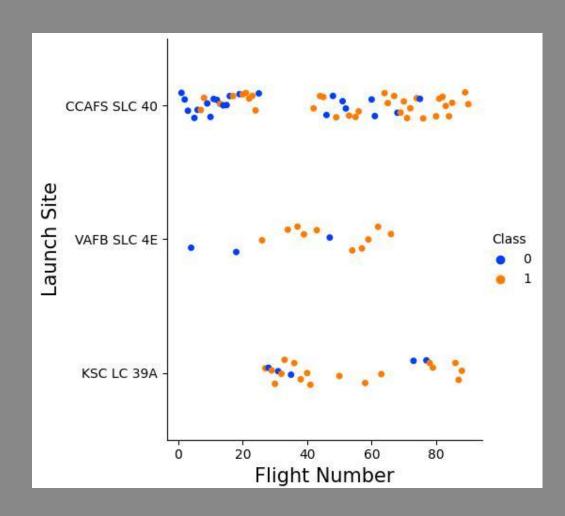

EDA with Data Visualization

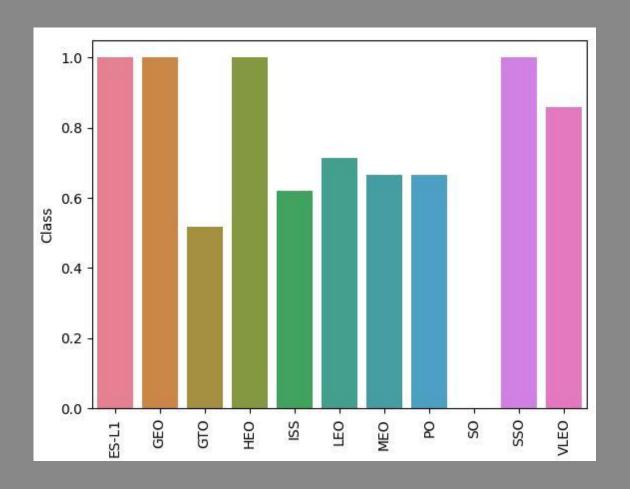

Launch Site VS Flight Number

- Success rates improve as the number of flights increases at each launch site.
- Early flights (Flight Number < 30) from CCAFS SLC 40 and VAFB SLC 4E had a higher rate of failure, with fewer successful landings.
- * KSC LC 39A shows a higher success rate overall, especially since no early flights were launched from this site.
- Notably, after Flight Number 30, the majority of flights across all launch sites show a clear increase in successful landings (Class = 1).

Success Rate VS Orbit Type

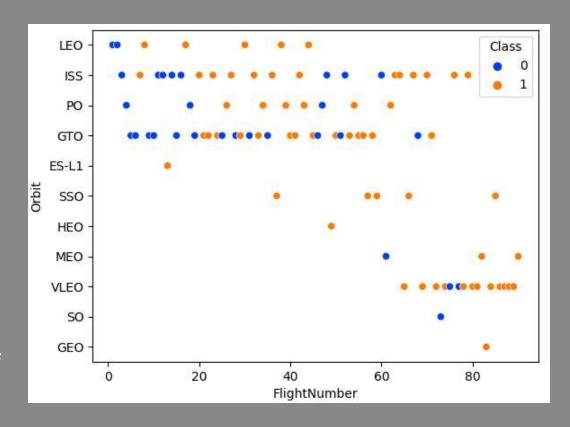

- Orbits with a 100% success rate include
 - ES-L1 (Earth-Sun First Lagrangian Point).
 - GEO (Geostationary Orbit).
 - HEO (High Earth Orbit).
 - SSO (Sun-synchronous Orbit).
 - The orbit with the lowest success rate (0%) is:
 - SO (Heliocentric Orbit)

Orbit Type VS Flight Number

This scatter plot illustrates the relationship between Orbit Type and Flight Number, highlighting several key insights:

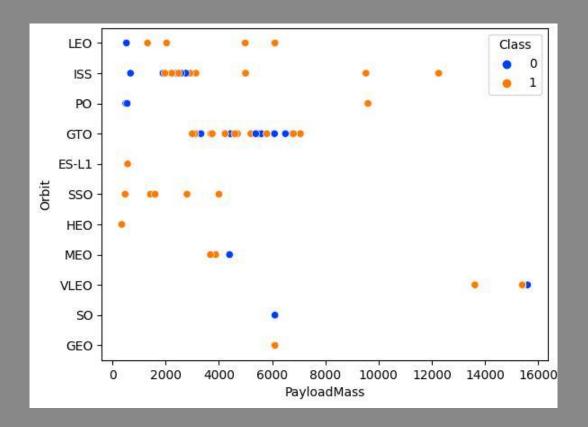

- GEO, HEO, and ES-L1 orbits have a 100% success rate, though it's worth noting that each of these categories only had a single flight.
- SSO orbits demonstrate an impressive 100% success rate over 5 successful flights.
- For GTO orbits, there is minimal correlation between the number of flights and the success rate.
- LEO orbits exhibit a trend where higher flight numbers are associated with increased success rates. Early flights, with lower flight numbers, experienced a greater number of unsuccessful landings.

Orbit Type VS Payload Mass

This scatter plot shows the relationship between Orbit Type and Payload Mass, highlighting:

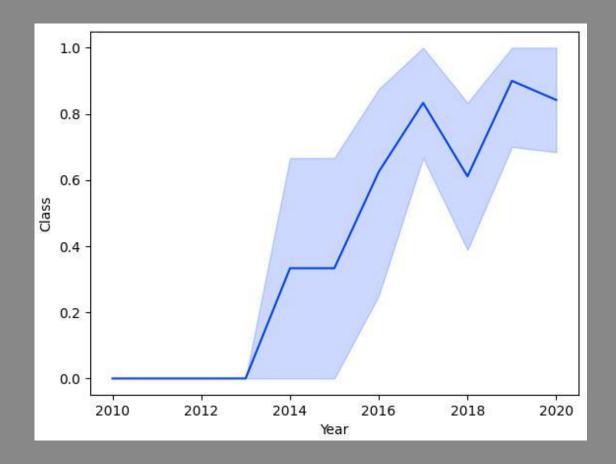

- PO, ISS, and LEO achieve higher success rates with heavier payloads, though data for PO is limited.
- For GTO, there's no clear pattern between payload mass and success rate.
- VLEO missions often involve heavier payloads, which makes sense given their proximity to Earth.

Launch Success Yearly Trend

This line chart tracks the yearly average success rate:

- From 2010 to 2013, all landings failed with a 0% success rate.
- Success rates began to improve after 2013, with small declines in 2018 and 2020.
- Since 2016, success rates have consistently exceeded 50%.

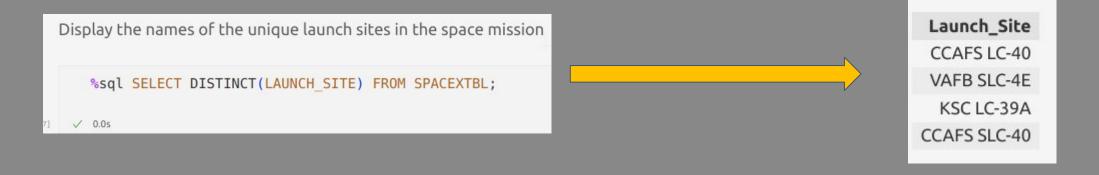

EDA with SQL

All Launch Site Names

Find the names of the unique launch sites.

The word DISTINCT returns only unique values from the LAUNCH_SITE column of the SPACEXTBL

Launch Site Names Begin with 'CCA'

Find 5 records where launch sites begin with 'CCA'

%sql SELECT LAUNCH_SITE FROM SPACEXTBL WHERE LAUNCH_SITE LIKE 'CCA%' LIMIT 5;

CCAFS LC-40 CCAFS LC-40 CCAFS LC-40 CCAFS LC-40 CCAFS LC-40

LIMIT 5 fetches only 5 records, and the LIKE keyword is used with the wild card 'CCA%' to retrieve string values beginning with 'CCA'.

Total Payload Mass

Calculate the total payload carried by boosters from NASA.

The SUM keyword is used to calculate the total of the LAUNCH column, and the SUM keyword (and the associated condition) filters the results to only boosters from NASA (CRS)

Average Payload Mass by F9 V1.1

Calculate the average payload mass carried by booster version F9 v1.1

```
%*sql
SELECT AVG(PAYLOAD_MASS_KG_) AS AVERAGE_PAYLOAD_MASS FROM SPACEXTBL
WHERE BOOSTER_VERSION = 'F9 v1.1';

2928.4
```

The AVG keyword is used to calculate the average of the PAYLOAD_MASS__KG_ column, and the WHERE keyword (and the associated condition) filters the results to only the F9 v1.1 booster version.

First Successful Ground Landing Date

Find the dates of the first successful landing outcome on ground pad.

%%sql
SELECT MIN(DATE) AS FIRST_SUCCESSFUL_GROUND_LANDING FROM SPACEXTBL
WHERE LANDING_OUTCOME = 'Success (ground pad)';

FIRST_SUCCESSFUL_GROUND_LANDING
2015-12-22

The MIN keyword is used to calculate the minimum of the DATE column, i.e. the first date, and the WHERE keyword (and the associated condition) filters the results to only the successful ground pad landings

Successful Drone Ship Landing with Payload between 4000 and 6000

List the names of boosters which have successfully landed on drone ship and had payload mass greater than 4000 but less than 6000.

The WHERE keyword is used to filter the results to include only those that satisfy both conditions in the brackets (as the AND keyword is also used). The BETWEEN keyword allows for 4000 < x < 6000 values to be selected.

Total Number of Successful and Failure Mission Outcomes

Calculate the total number of successful and failure mission outcome

The COUNT keyword is used to calculate the total number of mission outcomes, and the GROUPBY keyword is also used to group these results by the type of mission outcome

Boosters Carried Maximum Payload

List the names of the booster which have carried the maximum payload mass.

```
%%sql
   SELECT DISTINCT(BOOSTER_VERSION) FROM SPACEXTBL
   WHERE PAYLOAD_MASS__KG_ = (SELECT MAX(PAYLOAD_MASS__KG_) FROM SPACEXTBL);
```

Booster_Version F9 B5 B1048.4 F9 B5 B1049.4 F9 B5 B1051.3 F9 B5 B1056.4 F9 B5 B1048.5 F9 B5 B1051.4 F9 B5 B1049.5 F9 B5 B1060.2 F9 B5 B1058.3 F9 B5 B1051.6 F9 B5 B1060.3 F9 B5 B1049.7

The WHERE keyword is used to filter the results for only failed landing outcomes, AND only for the year of 2015.

2015 Launch Records

List the failed landing_outcomes in drone ship, their booster versions, and launch site names for in year 2015.

```
%%sql
| SELECT BOOSTER_VERSION, LAUNCH_SITE FROM SPACEXTBL
| WHERE (Landing_Outcome = 'Failure (drone ship)') AND strftime('%Y', Date) = '2015';
```

Booster_VersionLaunch_SiteF9 v1.1 B1012CCAFS LC-40F9 v1.1 B1015CCAFS LC-40

A subquery is used here. The SELECT statement within the brackets finds the maximum payload, and this value is used in the WHERE condition. The DISTINCT keyword is then used to retrieve only distinct /unique booster versions.

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order.

```
%%sql SELECT Landing_Outcome, COUNT(Landing_Outcome) AS TOTAL_NUMBER FROM SPACEXTBL
WHERE Date BETWEEN '2010-06-04' AND '2017-03-20'
GROUP BY Landing_Outcome
ORDER BY TOTAL_NUMBER DESC;
```

Landing_Outcome TOTAL_NUMBE	
No attempt	10
Success (drone ship)	5
Failure (drone ship)	5
Success (ground pad)	3
Controlled (ocean)	3
Uncontrolled (ocean)	2
Failure (parachute)	2
Precluded (drone ship)	1

The WHERE keyword is used with the BETWEEN keyword to filter the results to dates only within those specified. The results are then grouped and ordered, using the keywords GROUP BY and ORDER BY, respectively, where DESC is used to specify the descending order

Launch Sites Proximity Analysis Folium Interactive Map

Proximities

Proximities such as railway, highway, coastline, with distance calculated and displayed.

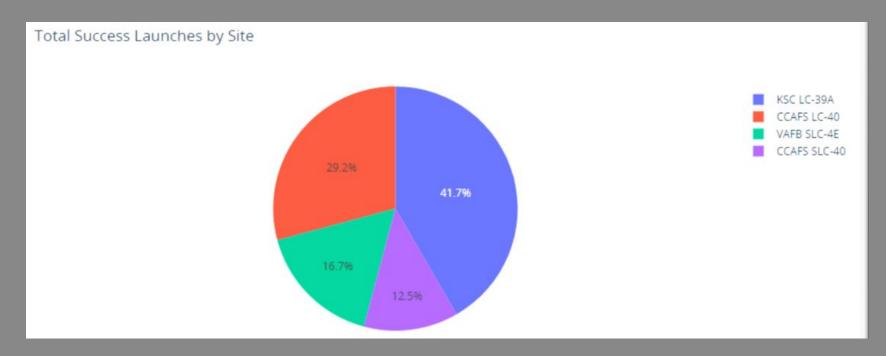

Build a Dashboard with Plotly Dash

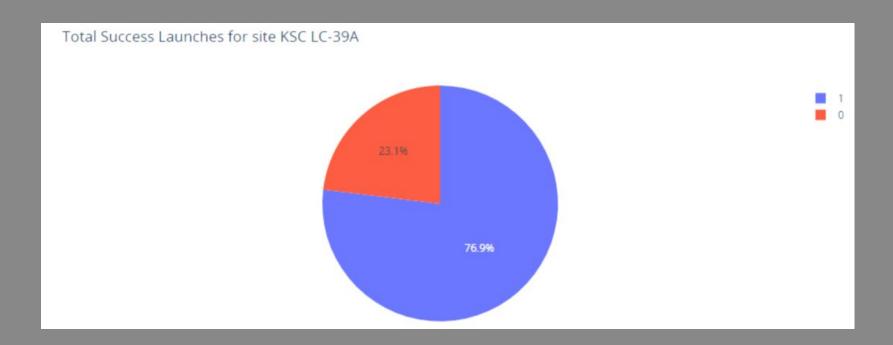

Launch Success Count for all Sites

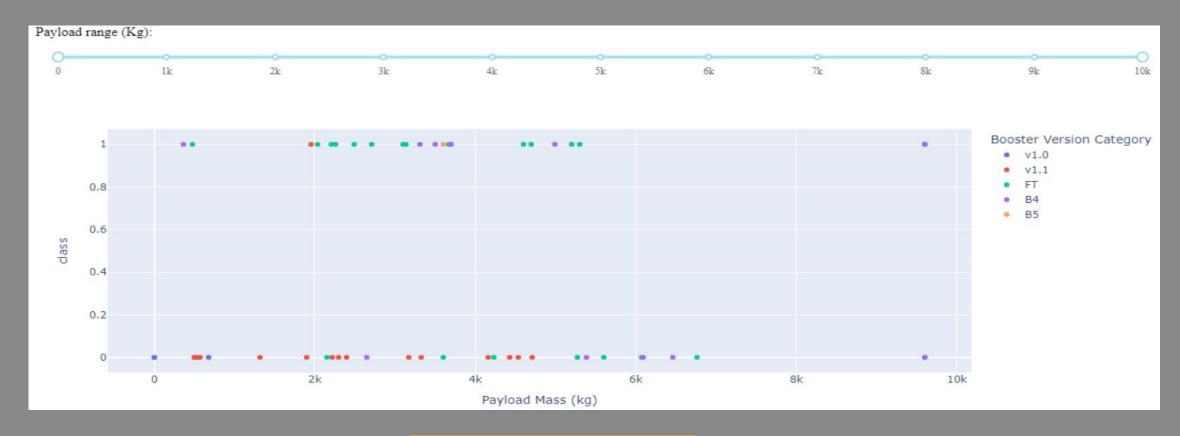

The launch site KSC LC-39A had the most successful launches, with 41.7% of the total successful launches.

Pie chart of KSC LC 39A

The launch site KSC LC-39 A also had the highest rate of successful launches, with a 76.9% success rate.

Payload vs Launch Outcome scatter

The scatter plot reveals that as payload mass increases, the success rate improves for the FT booster version. In contrast, the v1.1 booster version shows the opposite trend, with a higher rate of failures for heavier payloads.

Predictive Analysis- Classification

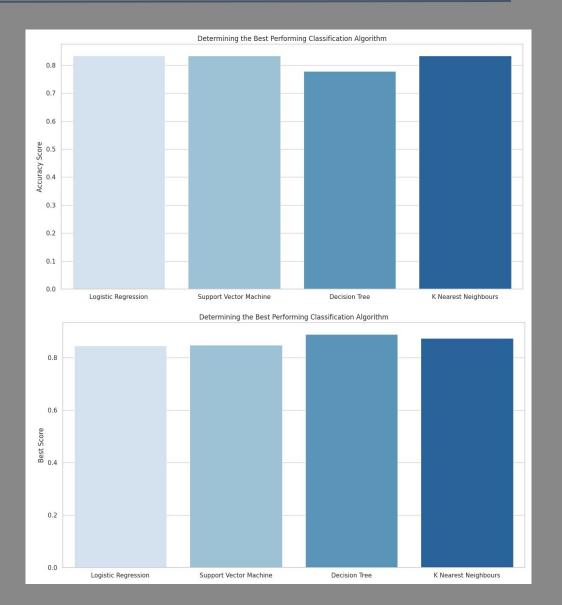

Payload vs Launch Outcome scatter

Plotting the Accuracy Score and Best Score for each classification algorithm produces the following result:

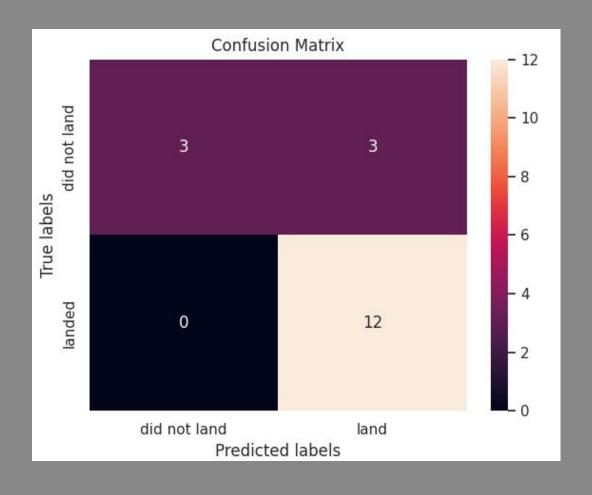

- The Logistic Regression model has the highest classification accuracy
- The Accuracy Score is 84%.

	Algorithm	Accuracy Score	Best Score
0	Logistic Regression	0.833333	0.846429
1	Support Vector Machine	0.833333	0.848214
2	Decision Tree	0.777778	0.889286
3	K Nearest Neighbours	0.833333	0.875000

Payload vs Launch Outcome scatter

- As shown previously, best performing classification model is the Logistic Regression, with an accuracy of 84%.
- This is explained by the confusion matrix, which shows only 1 out of 18 total results classified incorrectly (a false positive, shown in the top-right corner).
- The other 17 results are correctly classified (5 did not land, 12 did land).

Conclusion

- As the flight number increases there's more success rate for Launch Site CCAFS SLC 40, the same relationship was observed for payload mass.
- There's 100% success rate of landing for Orbit type ES-L1, SSO, HEO, and GEO
- There's been steady increase in the success rate of Falcon 9 landing since 2010-2020
- With a very high accuracy of 88.89%, we know that our model can predict the outcome of the landing.

Appendix

All relevant assets like Python code snippets, SQL queries, charts, Notebook outputs, and data sets included in this presentation can be found on my <u>GitHub</u>.
